

Regarding increasing level of air pollution in Delhi-NCR and North India-Laid

According to the latest report (Annual Report) : The Delhi-NCR region has recorded a significant increase in air pollution levels over the past few years. The concentration of PM 2.5 has increased from 20 µg/m³ in 2015 to 500 µg/m³ in 2019, which is well above the WHO recommended limit of 25 µg/m³. The AQI has also increased from 3 in 2015 to 22 in 2019. The increase in air pollution is attributed to various factors, including the rapid growth of the economy, the increase in the number of vehicles, and the lack of adequate infrastructure for public transport. The government has taken several measures to reduce air pollution, including the implementation of the National Clean Air Programme (NCAP) and the introduction of the GRAP system. However, more needs to be done to ensure that the air quality in Delhi-NCR and North India improves.
